DESCRIPTION

Technocare wishes to implement a project to provide far more comprehensive materials' information and traceability capability.

This implementation will be carried out mainly through the building and installation of a customized management system tailored to the needs of individual businesses to enable them to offer customers additional services as required.

OBJECTIVE

The platform upgrade will involve deploying additional information management capability, including materials traceability, which will enable the business to provide clients with a broader range of high-quality services, as well as also opening up opportunities to tap into new markets.

Component traceability will make it possible to trace the history, application and location of a component by means of recorded identifications, from the manufacture of the component to the apparatus in which it has been installed, - all in full compliance with quality manage-

RESULTS

The project will lead to improved quality of the business's offering, by providing its clients with this additional service Traceability will provide fundamental information that can then be utilized for a variety of purposes such as process improvement, defect solutions, and regulatory compliance. This will lead to a major step-change in efficiency – both internally, for the business, and externally, for the client – which will constantly improve every aspect of quality for both partners.
